Subject: Health impacts from Lead in Residential Soil

Hello Sophia,

My name is Su Patel; with the Department of Toxic Substances Control. I am working on the Exide Facility Closure and Cleanup – including the residential areas impacted from Exide's stack emissions.

Currently, DTSC continues to oversee cleanup of residential areas. These areas include 219 properties and were identified as most likely to be impacted, based on SCAQMD's air modelling data. Since then DTSC has ordered and received data on step-out sampling in the expanded area that goes approximately 2 miles in the north and the south from the facility. The data does not show any simple pattern of dispersion although we have some hits above 1000 ppm.

DTSC would like to bring together a group of health experts and toxicologists and discuss health impacts from lead concentrations seen in soil from some of the residential yards.

Deldi Reyes of US EPA from your office was present at our last advisory group meeting on July 23 and she suggested yourself as the person to talk to. Please let me know your availability so I can schedule a conference call/meeting sometime next week. If you can propose a couple of dates, I will work with the technical staff here to set-up a date and time that works for you.

Thank you

Su
